Overview

ReView is a powerful automated discovery and scanning tool that finds, catalogs, and analyzes your network topography. Using ReView, you can quickly find and view used and free IPs, giving your company the opportunity to efficiently consolidate used space and view the resulting potential market rate of your aggregated unused IP space.

Requirements and Installation

ReView is a locally downloaded tool with minimal system requirements. The hosting system must be connected to the internet for ReView to process scans.

To install, log in as the system administrator user (or select “run as administrator”) and download the provided build file for your OS (Windows, MacOS, and Linux are supported). Once downloaded, unzip the file and double click on the application name/icon in order to open.

For additional information, see the documentation sections below:

 - [Appearance Options](#)
 - [Cache](#)
 - [Pricing](#)
 - [Logs](#)
- [Additional Information:](#)

UI Overview

Navigation

To navigate through ReView, click the tabs and sub-tabs at the top of the application. The major tabs are:

- [Home](#) - The Home page is the initial page displayed while in ReView. Tiles display current discovery progress, inventory, scan to-do list, and visualization tools for your network.
- [Discovery](#) - The Discovery tab is the first step to identifying network resources to add to your inventory. Here, you can use configuration files, paste text configs, or use automated scanning options to identify devices to use for Discovery. Available discovery / device identification options include: DHCP, DNS, Firewall, Generic Config, mDNS, Load Balancer, Ping Scan, RIR, Router Configs, SNMP, ARP, SSDP, and Cloud Providers.
- [To-Do List](#) - The To-Do list identifies and marks neighboring devices encountered during router discovery scanning, and lists them for future scanning.
- [Inventory](#) - The Inventory tab displays an organized list of all discovered netblocks, IPs, sources, and their associated metadata. Here, for each netblock you can view RIR, Source, CIDR, use status, IPs found, total IPs, IP utilization, and start/end address.

- **Analyze** - The Analyze tab interprets the IP inventory data found during Discovery, and determines valuation of free IPv4 space based on the current network structure.
- **Planning** - The Planning tab shows the potential value of saved plan strategies, and the configuration differences for each plan.
- **Export** - Export will prepare a report on the state of your network and email it to both you and to IPv4.Global/ Hilco. You may also download a PDF Report, or upload data into 6connect ProVision.

Additional helpful pages include:

- Settings (slider icon) - Set appearance theme, clear cache, or review pricing and log data.
- About (question icon) - Displays the EULA for ReView
- Documentation (book icon) - Provides a link to ReView's online documentation.

Settings

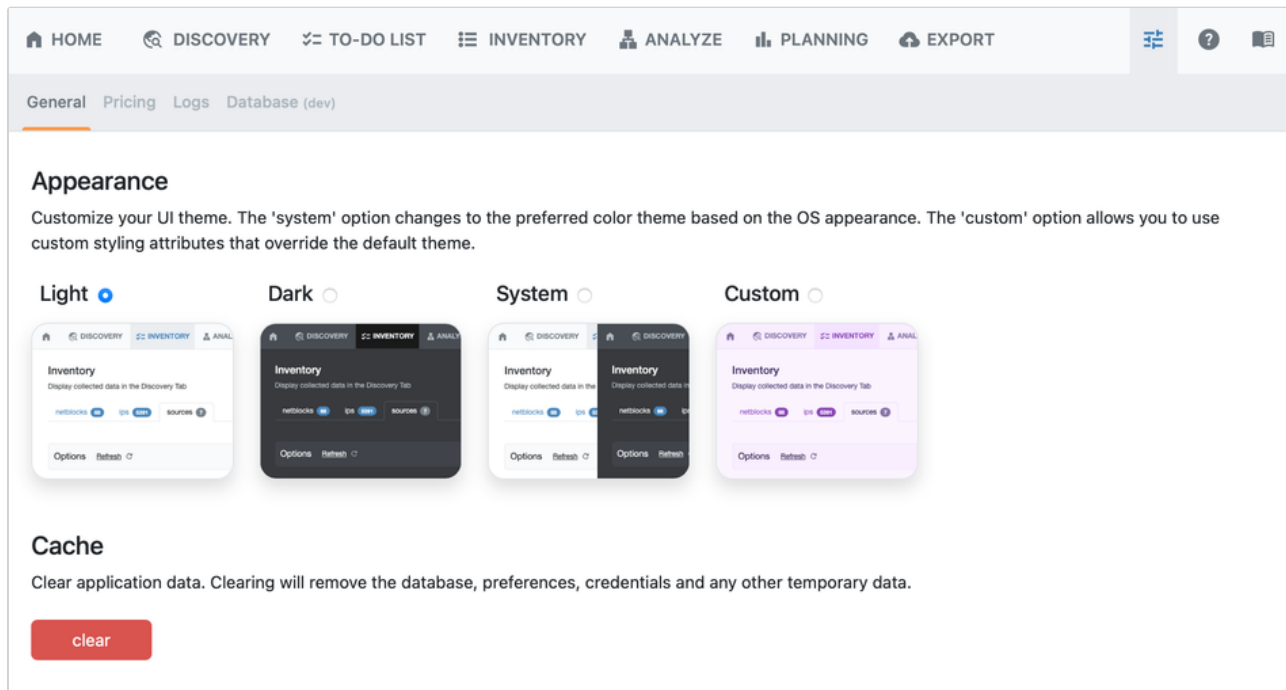

Click the settings icon at the top right of the navigation bar to open ReView settings.

General Settings

Appearance Options

ReView supports light and dark themes according to your system settings. You may choose between light mode, dark mode, OS based, or custom appearance settings.

For custom settings, select "Custom" and then paste the desired custom CSS to override default attributes. Edits made to Custom Styles are saved automatically.

Appearance

Customize your UI theme. The 'system' option changes to the preferred color theme based on the OS appearance. The 'custom' option allows you to use custom styling attributes that override the default theme.

Edit custom style (auto save)

```
div {
  background-color: lavender;
}
body, h1, h2, h3, h4, h5, h6 {
  font-family: Courier New;
  color: indigo;
}
```

Cache

Clear application data. Clearing will remove the database, preferences, credentials and any other temporary data.

clear

Cache

Clearing the cache clears all application data, including removing the database, preferences, credentials, and temporary data.

⚠ Clearing the cache should only be in circumstances where a full 'reset' is necessary. Use with caution.

Pricing

The pricing data used for estimated values under the Analyze and Planning tabs is accessible under Settings → General → Pricing. Searchable price lists are available for both ARIN and RIPE.

Block Size	Price Per IP	Variable	Min Block Price	Max Block Price
/8	\$70.00	10%	\$1,056,964,608.00	\$1,291,845,632.00
/9	\$68.00	10%	\$513,382,809.60	\$627,467,878.40
/10	\$66.00	10%	\$249,141,657.60	\$304,506,470.40
/11	\$64.00	10%	\$120,795,955.20	\$147,639,500.80
/12	\$62.00	10%	\$58,510,540.80	\$71,512,883.20
/13	\$58.00	10%	\$27,367,833.60	\$33,449,574.40

Logs

The Logs tab displays logging information and ignored blocks.

CIDR	Description	Start Address	End Address
0.0.0.0/8	"This network" [RFC791], Section 3.2	0.0.0.0	0.255.255.255
6.0.0.0/8	Army Information Systems Center	6.0.0.0	6.255.255.255

- [Analyze](#)
- [Planning](#)
- [Export](#)

Home Page & Getting Started

ReView Home Page

The Home page is the initial page displayed while in ReView. Here, dashboard tiles show current discovery progress, inventory, scan to-do list, and visualization tools for your network. Links will be displayed to set up initial configuration and discovery steps to start using the scanning tool.

Getting Started

When you first open ReView, take a look at the links available on the Home page.

Demo data is available for you to explore the features and visualizations of ReView prior to importing your own network data.

If desired, open settings to customize your appearance to light mode, dark mode, or system-based.

Workflow:

When you are ready to start scanning, we recommend proceeding in the following order:

1) Network Discovery & Scans

Where: [Home](#); [Discovery Tab](#); [To-Do List](#)

- The best place to start is using the RIR Scan on the [Discovery](#) tab. Enter an IP (or use the default public IP found), click “scan”, and it will query ARIN, RIPE, APNIC, LACNIC, and AFRINIC for officially allocated IP resources.
- Next, identify sub-blocks and hosts by supplying Router Configs or DNS Zones, or by scanning ARP tables or scanning DHCP leases files.
- Additional options under Discovery include items such as Firewalls, Load Balancers, SNMP, SSDP, and even a “Generic Config” option for other non-supported devices.
 - Data may be provided either by uploading config files (Note: Must be either .zip or .tar files) or by pasting the configuration text.
- Check the To-Do List to perform Ping Scans
 - If neighboring devices are encountered during an SNMP, SSH, Config, or Ping scan, they are added to the To-Do list and flagged for later user review and scanning to complete network segments.

2) Review and Update Inventory Status

Where: [Inventory Tab](#)

- During discovery scanning, found netblocks, ips and sources will be added to the [Inventory](#) page for review.
 - You may manually add additional blocks, update or change block status, add attributes, ignore blocks, or add sources from this area.
- Confirm the use status for the netblocks / IPs in inventory - the use status (unknown, in use, free, ignored) will determine whether the block is sellable and optimization strategy steps.

3) Analyze Inventory and Get Suggested Plans

Where: [Analyze Tab](#)

- After discovery scans and any necessary inventory review is complete, proceed to the [Analyze](#) tab. The tab will display an estimated value of your public IP space based on the current inventory. It can be used to identify areas where your network can be made more efficient. Suggested plans may be saved for later review.
 - If any change occurs in the data, click on "Reinitialize" to refresh the analysis.

4) Review Plans and Export

Where: [Planning Tab](#); [Export Tab](#)

- The [Planning](#) tab shows the potential value of saved plan strategies, and the configuration differences for each plan.
- If desired, you may navigate to the [Export](#) tab to prepare a report on the state of your network and email it to both you and to IPv4Global. You may also download a PDF report, or upload your data into 6connect ProVision.

Next Steps:

Continue on to the [Discovery](#) section for to start scanning your network.

Discovery

The Discovery tab is first step to identifying network resources to add to your inventory. Here, you can use configuration files, paste text configs, or use automated scanning options to identify devices to use for discovery.

The Discovery tab allows the user to gather IP topography data via the following methods, organized as sub-tabs: DHCP, DNS, Firewall, Generic Config, mDNS, Load Balancer, Ping Scan, RIR, Router Configs, SSH Router Config, SNMP, ARP, and SSDP.

Discovery Tab Options

RIR

RIR Scan is the recommended first step in discovering your network assets.

RIR discovery establishes a baseline of public space. From here, ReView will use the current user's IP / provided IP, and then query the WHOIS system to find its ASN. From there, it queries again in order to discover netblock allocations.

When you open RIR Scan, your public IP is automatically populated, though you may also manually enter an IP.

RIR Scan

Supply an IP address to query ARIN, RIPE, APNIC, LACNIC, and AFRINIC for officially allocated IP resources.

IP Address

Your public IP is: 35.129.203.235

[Scan](#)

Enter the desired IP address and click "Scan".

RIR Scan

Supply an IP address to query ARIN, RIPE, APNIC, LACNIC, and AFRINIC for officially allocated IP resources.

IP Address

Your public IP is: 35.129.203.235

[Scan](#)

Activity

Last status: Search completed! 4 netblocks discovered.

Output

```

SUCCESS | Search completed! 4 netblocks discovered.
WARNING | Unable to discover any additional route/route6 prefixes
INFO | Found netblock 67.221.240.0/20
INFO | Found netblock 2607:fc28:0:306:0:0:0:0/64
INFO | Found netblock 2607:fae0:4000:0:0:0:0:0/48
INFO | Found netblock 2607:fae0:0:0:0:0:0:0/32
INFO | Getting netblocks...
INFO | Organization info: {"CONNE-81":"6connect, Inc."}
INFO | Getting organization info...
INFO | RIR detected: ARIN
INFO | Process started...
    
```

After a successful scan, flags will appear on the To-Do List and Inventory tabs to indicate pending actions.

DHCP

Connects to DHCP usage logs. ReView uses this to determine whether allocated DHCP subnets can be shrunk. Currently supports ISC DHCP, though Microsoft support is expected in a future release.

The screenshot shows the 'DISCOVERY' section of a web application. The navigation bar includes 'HOME', 'DISCOVERY', 'TO-DO LIST', 'INVENTORY', 'ANALYZE', 'PLANNING', and 'EXPORT'. Below the navigation bar, there is a sub-menu with 'DHCP', 'DNS', 'Firewall', 'Generic Config', 'mDNS', 'Load Balancer', 'Ping Scan', 'RIR', 'Router Configs', 'SSH Router Config', 'SNMP', 'ARP', 'SSDP', and 'Cloud Providers'. The main content area is titled 'DHCP Discovery' and contains the following elements:

- A sub-menu with 'ISC DHCP Leases', 'ISC DHCP Config', and 'SSH Discovery'.
- Instructions: 'Supply DHCP files or credentials to an ISC DHCP Server to discover hosts and add them to the inventory.'
- Options: 'Start by [Uploading a File](#) or [Paste a configuration text](#)'.
- A file selection box titled 'Select a dhcpd leases file:' with a 'Choose File' button and 'no file selected' text.
- Instructions: 'Select a plain text configuration file or a compressed file with several configurations to start a batch parse. ZIP and TAR files are supported.'
- Buttons: 'Reset' and 'Parse File'.

DNS

Supply DNS Zone files or credentials to an ISC Bind DNS Server to discover hosts. A config file may be uploaded or configuration text pasted directly into the text field.

The screenshot shows the 'DNS Zones' section of a web application. The navigation bar and sub-menu are identical to the DHCP Discovery page. The main content area is titled 'DNS Zones' and contains the following elements:

- A sub-menu with 'Input File' and 'SSH Discovery'.
- Instructions: 'Supply DNS Zone files or credentials to an ISC Bind DNS Server to discover hosts and add them to the inventory.'
- Options: 'Start by [Uploading a File](#) or [Paste a configuration text](#)'.
- A file selection box titled 'Select a zone config file:' with a 'Choose File' button and 'no file selected' text.
- Instructions: 'Select a plain text configuration file or a compressed file with several configurations to start a batch parse. ZIP and TAR files are supported.'
- Buttons: 'Reset' and 'Parse File'.

Firewall

Connects to Firewall configs (OPNsense, Palo Alto, Fortinet). A config file may be uploaded or configuration text pasted directly into the text field.

Firewall Config

Supply a config file for a OPNsense, PaloAlto, or Fortinet Firewall device to discover network objects and add them to the Inventory.

Start by [Uploading a File](#) or [Paste a configuration text](#)

Select a config file:

no file selected

Select a plain text configuration file or a compressed file with several configurations to start a batch parse. ZIP and TAR files are supported.

Generic Config

Attempts to parse non-supported devices via a config file in order to identify network resources and add them to the inventory.

Generic Config

Supply a config file for a non-supported device and the Generic Parser will attempt to identify network resources and add them to the inventory.

Start by [Uploading a File](#) or [Paste a configuration text](#)

Select a config file:

no file selected

Select a plain text configuration file or a compressed file with several configurations to start a batch parse. ZIP and TAR files are supported.

mDNS

Scans for Multicast DNS identifiable devices. Simply enter a service, domain, and a timeout (in seconds).

HOME DISCOVERY TO-DO LIST INVENTORY ANALYZE PLANNING EXPORT

DHCP DNS Firewall Generic Config mDNS Load Balancer Ping Scan RIR Router Configs SSH Router Config SNMP ARP SSDP Cloud Providers

Multicast DNS

Use the form below to scan for mDNS-identifiable devices and add them to the inventory. Depending on the settings, not all devices may be discovered.

Service

Specify the service you want to discover on your local network.

Domain

Enter the domain name for the service you're looking for.

Timeout (seconds)

Set the time in seconds for the scanner to search for services. The default value is 15 seconds.

[Scan](#)

Load Balancer

Connects to Load Balancer configs (F5). A config file may be uploaded or configuration text pasted directly into the text field.

HOME DISCOVERY TO-DO LIST INVENTORY ANALYZE PLANNING EXPORT

DHCP DNS Firewall Generic Config mDNS Load Balancer Ping Scan RIR Router Configs SSH Router Config SNMP ARP SSDP Cloud Providers

Load Balancer

Supply a config file for a F5 Load Balancer to discover network objects and add them to the inventory.

Start by [Uploading a File](#) or [Paste a configuration text](#)

Select a config file:

no file selected

Select a plain text configuration file or a compressed file with several configurations to start a batch parse. ZIP and TAR files are supported.

[Reset](#) [Parse File](#)

Ping Scan

Enter a CIDR to detect hosts and add to the inventory. The scan can be adjusted via a slider to emphasize either speed or accuracy or balanced between the two options.

It is recommended to perform a ping scan after an RIR scan in order to discover individual hosts.

Ping Scan

Supply a scan range in CIDR notation (ex: 192.168.0.0/24) to detect hosts and add them to the inventory.

CIDR:
16.98.0.0/16

Adjust scan accuracy (2)
Faster Reliable

Scan Clear results

Router Configs

The Router Config page allows the user to either paste full router configs, upload a single config file, or provide an archive of files. ReView parses these configs for configured networks.

Currently supported router configs include the following:

- Cisco IOS
- Cisco IOS-XR
- Juniper
- Arista

To upload a config file, from the “Uploading a File” section; select a plain text configuration file or a compressed file with several configurations, and click “Parse File”.

HOME DISCOVERY TO-DO LIST INVENTORY ANALYZE PLANNING EXPORT
DHCP DNS Firewall Generic Config mDNS Load Balancer Ping Scan RIR Router Configs SSH Router Config SNMP ARP SSDP Cloud Providers

Router Config Parser

The parser will find all netblocks and neighbors and add them to the scanner Inventory.

Start by [Uploading a File](#) or [Paste a configuration text](#)

Select a config file:
Choose File no file selected

Select a plain text configuration file or a compressed file with several configurations to start a batch parse. ZIP and TAR files are supported.

Reset Parse File

To paste a router config, select “Paste a configuration text”, paste your content, and click “Parse File”.

Router Config Parser

The parser will find all netblocks and neighbors and add them to the scanner Inventory.

Start by [Uploading a File](#) or [Paste a configuration text](#)

Paste config file content:

Paste Config Here

Reset [Parse File](#)

SSH Router Config

You may also provide credentials for a router, connect via SSH, and then extract the router config in order to integrate it into the tool.

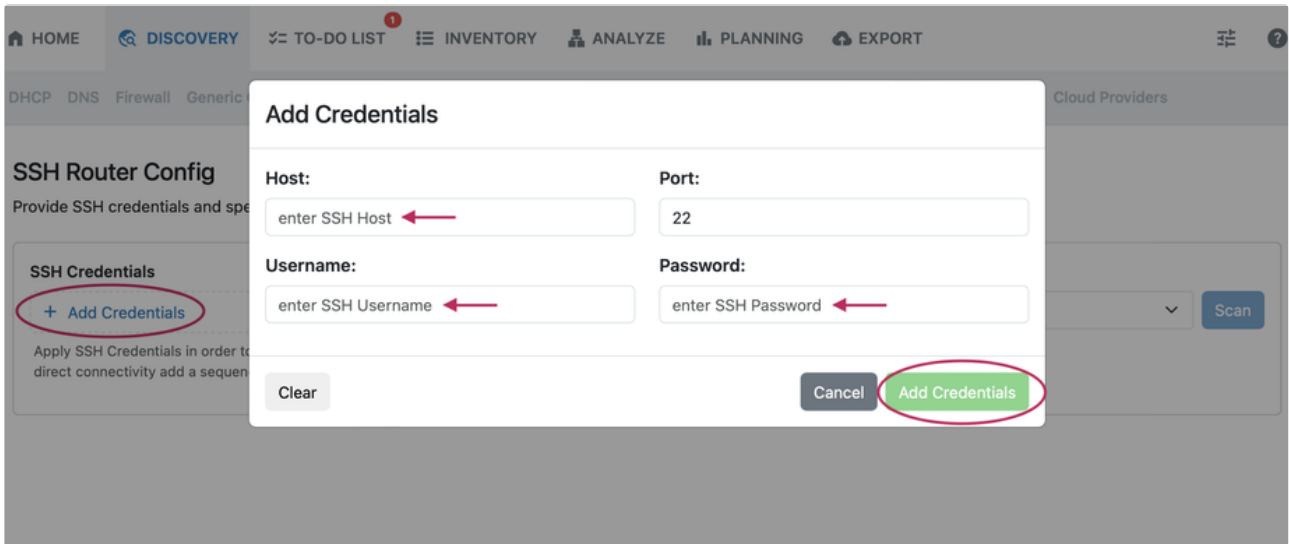

Select a router type from the dropdown and then click "Add Credentials".

SSH Router Config

Provide SSH credentials and specify the router type to extract the Router Config and integrate it into the network tool.

<p>SSH Credentials</p> <p>+ Add Credentials</p> <p>Apply SSH Credentials in order to analyze a router's loaded configuration. If you don't have direct connectivity add a sequence of SSH Routes (jump hosts).</p>	<p>Router Type</p> <p>Cisco XE Router ▼ Scan</p>
---	--

Enter SSH credentials in the resulting form and click the "Add" button.

SNMP

To initiate an SNMP scan, enter credentials and a router IP.

ARP

Supply SSH credentials and a router type to fetch the ARP table and add its contents to the inventory

The screenshot shows the 'ARP' configuration page. At the top, there is a navigation bar with 'HOME', 'DISCOVERY', 'TO-DO LIST', 'INVENTORY', 'ANALYZE', 'PLANNING', and 'EXPORT'. Below this is a sub-menu with 'DHCP', 'DNS', 'Firewall', 'Generic Config', 'mDNS', 'Load Balancer', 'Ping Scan', 'RIR', 'Router Configs', 'SSH Router Config', 'SNMP', 'ARP', 'SSDP', and 'Cloud Providers'. The 'ARP' section is active. It contains a title 'ARP' and a description: 'Supply SSH credentials and a router type to fetch the ARP table and add its contents to the inventory.' There are two main sections: 'SSH Credentials' with a '+ Add Credentials' link and a note about applying SSH credentials, and 'Router Type' with a dropdown menu set to 'Cisco XE Router' and a 'Scan' button.

Select a router type and click "Add Credentials". Enter credentials in the resulting form, and click the "Add" button.

The 'Add Credentials' form has four input fields: 'Host' (placeholder: 'enter SSH Host'), 'Port' (value: '22'), 'Username' (placeholder: 'enter SSH Username'), and 'Password' (placeholder: 'enter SSH Password'). At the bottom, there are three buttons: 'Clear', 'Cancel', and 'Add Credentials' (which is circled in red).

SSDP

Initiates a scan to search for devices responding to SSDP. The default timeout is 15 seconds.

The screenshot shows the 'SSDP' configuration page. It has the same navigation bar and sub-menu as the ARP page. The 'SSDP' section is active. It contains a title 'Simple Service Discovery' and a description: 'Initiate a scan to search for devices responding to SSDP and add them to the inventory. Depending on the settings, not all devices may be discovered.'

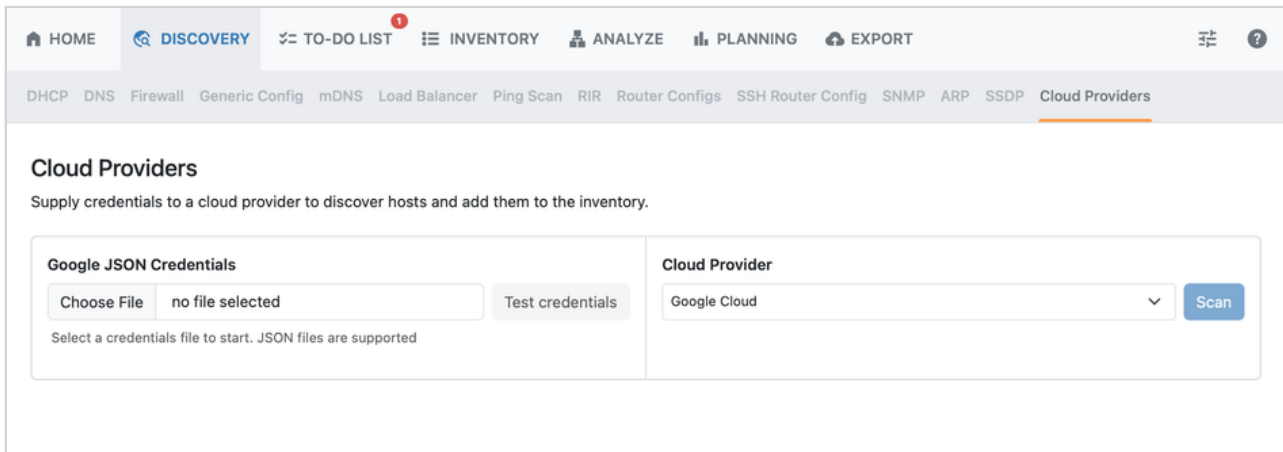

Simple Service Discovery

Initiate a scan to search for devices responding to SSDP and add them to the inventory. Depending on the settings, not all devices may be discovered.

The 'Simple Service Discovery' configuration form has a 'Timeout (seconds)' input field with a value of '15'. Below the input field is a note: 'Set the time in seconds for the scanner to search for services. The default value is 15 seconds.' At the bottom right, there is a 'Scan' button.

Cloud Providers

Select a cloud provider and enter credentials to scan cloud provider hosts and add them to the inventory.

The screenshot shows a web interface for 'Cloud Providers'. At the top, there is a navigation bar with tabs: HOME, DISCOVERY, TO-DO LIST (with a red notification badge), INVENTORY, ANALYZE, PLANNING, and EXPORT. Below the navigation bar is a breadcrumb trail: DHCP, DNS, Firewall, Generic Config, mDNS, Load Balancer, Ping Scan, RIR, Router Configs, SSH Router Config, SNMP, ARP, SSDP, and Cloud Providers (which is highlighted with an orange underline). The main content area is titled 'Cloud Providers' and contains the instruction: 'Supply credentials to a cloud provider to discover hosts and add them to the inventory.' Below this instruction is a form with two main sections. The first section is 'Google JSON Credentials', which includes a file selection button labeled 'Choose File' and a text field containing 'no file selected'. To the right of this field is a 'Test credentials' button. Below the text field is a small note: 'Select a credentials file to start. JSON files are supported'. The second section is 'Cloud Provider', which features a dropdown menu currently set to 'Google Cloud' and a blue 'Scan' button.

Next Steps

If neighboring devices have been discovered via the router config discovery option, those devices will be populated into the [To Do List](#) tab for further scanning.

Once one or more of the available Discovery modules has been processed, all found space will be loaded into the [Inventory](#) tab for display and auditing.

To-Do List

Address	SNMP Scan	SSH Scan	Config Scan	Ping Scan	Status	Options
10.100.1.1	SNMP	SSH	Select type		Pending	⚙️
10.100.1.20	SNMP	SSH	Select type		Pending	⚙️
10.100.1.31	SNMP	SSH	Select type		Pending	⚙️
10.100.1.32	SNMP	SSH	Select type		Pending	⚙️
10.100.1.33	SNMP	SSH	Select type		Pending	⚙️
41.91.0.0/16				Ping	Pending	⚙️
41.155.128.0/17				Ping	Pending	⚙️
41.190.248.0/22				Ping	Pending	⚙️
45.96.0.0/13				Ping	Pending	⚙️
45.101.0.0/16				Ping	Pending	⚙️

The To-Do list identifies and marks neighboring devices encountered during SNMP, SSH, router config, or ping discovery scanning. Users may then review, update the type of config scan, or mark with updated status flags.

Working with the To-Do List

The To-Do list is only populated from discovery runs where SNMP, SSH, router config, or ping scans encounter new neighboring devices. Once encountered, the address will be added to the list and the source marked (SNMP, SSH, Config, or Ping), so that users may return to the encountered devices to run additional scans, if needed.

To-Do List						
When new neighboring devices are discovered, they are added to the to-do list for future scanning.						
Results 2						
Address	SNMP Scan	SSH Scan	Config Scan	Ping Scan	Status	Options
0.0.0.0				Ping	Pending	⚙️
67.221.240.0/20				Ping	Pending	⚙️

Options

By default, the status of an encountered device is “pending”, serving as a reminder to review or scan the device. You may change the status at any time from the Options → Action menu (gear icon).

To-Do List						
When new neighboring devices are discovered, they are added to the to-do list for future scanning.						
Results 2						
Address	SNMP Scan	SSH Scan	Config Scan	Ping Scan	Status	Options
0.0.0.0				Ping	Pending	⚙️
67.221.240.0/20				Ping	Pending	⚙️

- Mark Pending
- Mark Scanned
- Mark Ignored

To mark the status of a device, right click anywhere on a row to open the Action Menu. You can choose from pending, scanned, or ignored.

Next Steps

Once the To-Do List items have been reviewed, scanned, or ignored as needed, proceed to the [Inventory](#) tab to review all netblocks, ips, and sources found during discovery.

Inventory

CIDR	Used IPs	Source	In use	CIDR Org.	Direct IPs	Total IPs in tree	RIR	Attributes	Options

The Inventory tab displays an organized list of all discovered subnets, IPs, and associated metadata.

Here, for each netblock you can view RIR, Source, CIDR, use status, IPs found, total IPs, IP utilization, and start/end address.

Netblocks List:

Netblocks Tab

CIDR	Used IPs	Source	In use	CIDR Org.	Direct IPs	Total IPs in tree	RIR	Attributes	Options

View Options:

The following view options are available in the Inventory list:

- Visibility: Select whether to view all netblocks/ips, ignored only, or unignored only.
- Show: Select the quantity of netblocks/ips to display per page.
- Search / Filter: Enter a CIDR or partial CIDR to filter to matching results.
- Column Resize: Column size may be manually adjusted by clicking and dragging on the vertical bar (pipe) between column headers.

Netblocks List Tree View:

Tree View shows child blocks in a hierarchy format. Click the +/- box next to the CIDR to expand or close the tree view hierarchy for the netblock.

The screenshot shows a web interface with a navigation bar (HOME, DISCOVERY, TO-DO LIST, INVENTORY, ANALYZE, PLANNING, EXPORT) and a search bar. Below the search bar, there are filters for 'netblocks (74)', 'ips (700255)', and 'sources (12)'. The main content area has a table with columns: CIDR, Used IPs, Source, In use, CIDR Org., Direct IPs, Total IPs in tree, RIR, Attributes, and Options. The table lists various CIDR blocks, some of which are expanded to show child blocks. The 'In use' column contains status indicators like 'Unknown' or 'In Use'. The 'Used IPs' column shows percentage progress bars. The 'Options' column contains a gear icon for each row.

CIDR	Used IPs	Source	In use	CIDR Org.	Direct IPs	Total IPs in tree	RIR	Attributes	Options

Refresh:

Click Refresh to check for updated data from the enabled sources.

Add Netblock:

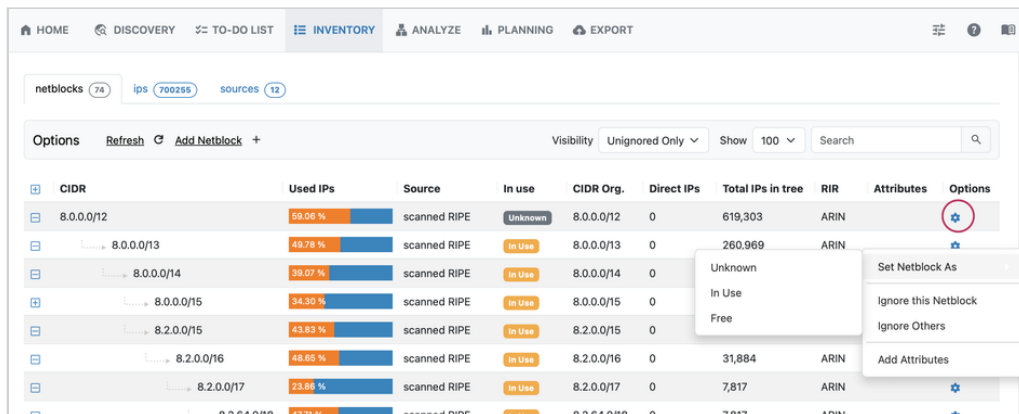

Click "Add Netblock" to manually add an undiscovered netblock to your inventory.

Select the RIR, enter the CIDR, and designate the source for the new netblock. If the netblock is known to be used, select the “In Use” radio to ensure that the proper status is associated with the netblock. You can also mark netblocks as Unknown, Free, or Ignored.

When done, click “Create”. The netblock will be added to inventory.

Netblock Options

For each netblock, the following options are available under Options → Action Menu (Gear Icon)

- Set status by selecting “Set Netblock As” and then choosing:
 - Unknown
 - In Use
 - Free
- Ignore this Netblock
- Ignore Others
- Add Attributes

- Add or edit attributes by selecting “Add Attributes”, entering the name-value pair, then click “Save”. You may also remove existing attributes by clicking “Remove” next to the desired attribute.

IPs Tab

View Options

The ips tab displays individual ip assets discovered during scanning, for user review. It contains the same view options as the netblocks tab - visibility, display count per page, and search/filter.

Additional CIDR-specific filtering options are available by clicking the filter icon next to the search box.

Enter the CIDR to filter to, and select one of the following options:

- CIDR direct: Returns only the ips which are directly in the netblock
- CIDR all: Returns all of the ips in the netblock, and its children

- Scan for Open Ports

Refresh

If data has changed due to additional scans, click “Refresh” to update the list.

Sources Tab

The Sources tab displays a chart of the discovery tab configurations used to populate and update the inventory tab. Select which sources to view by visibility status via the dropdown at upper right.

Here, you may review sources and their associated count of netblocks found. Scroll down to view the list of sources and associated data.

Name	Type	In use	IPs found	Netblocks found	Execution Time	Options
Manual	manual	Unknown	0	0	-	⚙️
Actions	generic	Unknown	0	0	-	⚙️
scanned RIPE	rir	Unknown	0	8,191	2023-09-19 18:41:20	⚙️
ARIN	rir	Unknown	694,454	1	2023-09-19 18:47:18	⚙️
Ping 67.221.240.0/20	ping scan	Unknown	233	1	2023-10-03 17:57:41	⚙️
Demo source	generic	Unknown	758	15	2023-10-05 19:23:11	⚙️

For each source, the following options are available under Options → Action Menu (Gear Icon)

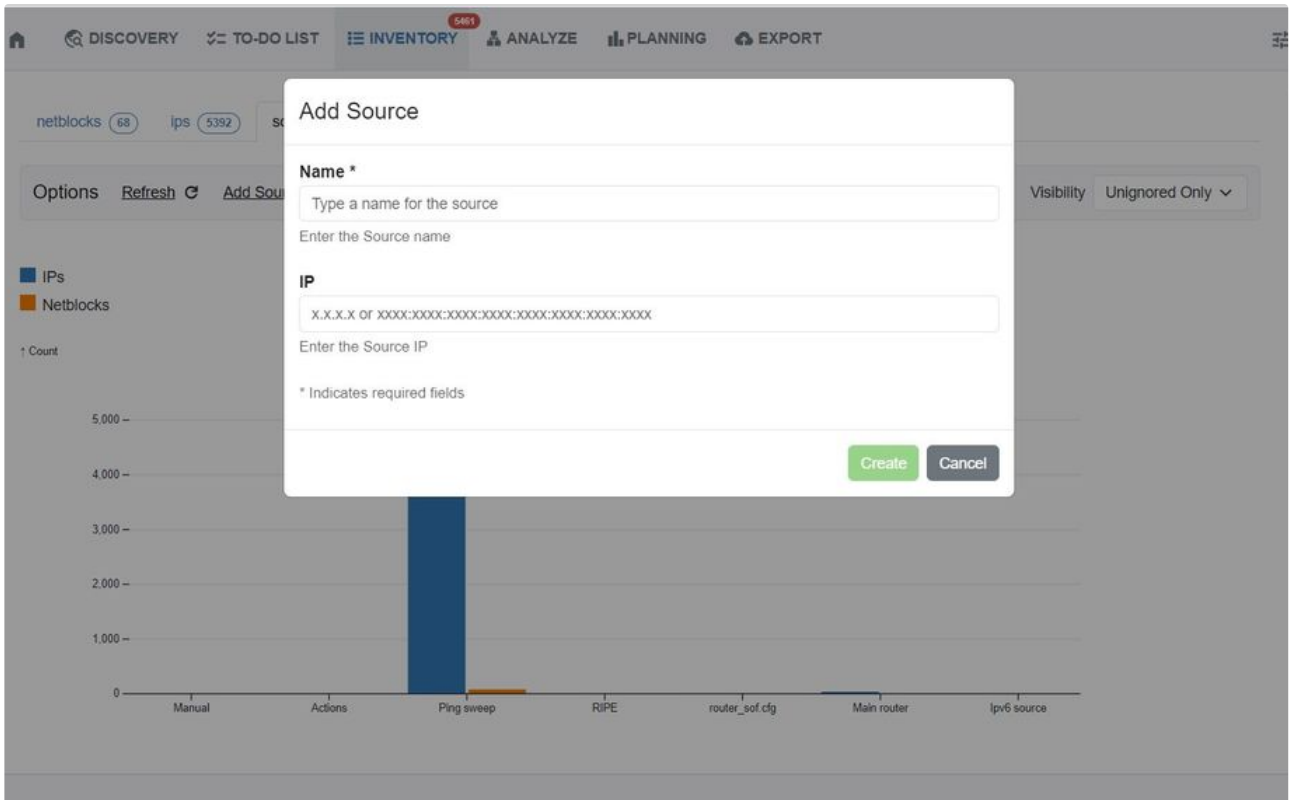

- Set visibility by selecting:
 - Ignore this Source
 - Ignore Others
 - Unignore Others

Add Source:

If needed, you may add additional sources not found during discovery scans.

Click “Add Source” to manually add a source.

Enter the Name and IP, then click “Create”.

Next Steps

After reviewing and adjusting your inventory and sources as desired, proceed to the [Analyze](#) tab to view free space and valuation based on your current network.

Analyze

The Analyze tab interprets the IP inventory data found during Discovery, and determines valuation of free IPv4 space based on the current network structure.

Analyze Blocks List

The Analyze tab Blocks List displays block inventory according to CIDR. It displays use status, sellable status, aggregatable status, and estimated min/max value of sellable space.

List Display options include the following:

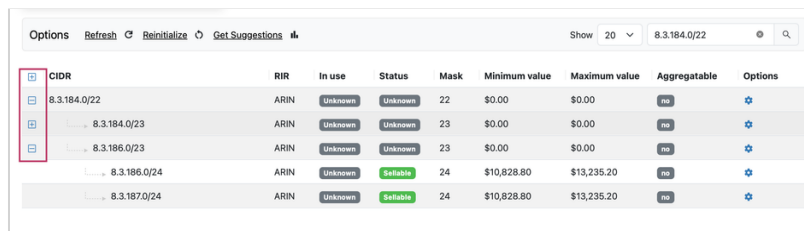

Filter / Search List:

At the top of the list, you can select the number of blocks to view per page (default is set to 20), and search/ filter for blocks.

Tree View:

Tree View shows child blocks in a hierarchy format. Click the +/- box next to the CIDR to expand or close the tree view hierarchy for the netblock.

List Options

List management options are available in the top header of the analyze list view:

- Refresh: Refreshes the list data from the database.
- Reinitialize: Performs a more intensive re-analysis of data and status from provided sources - this may take some time, depending on the amount of blocks in inventory and sources.
- Get Suggestions: Provides optimization strategies based on the current use and status of the netblocks. Suggestions may be saved as a named optimization plan to compare against additional suggested plans under the Planning tab.

Virtual Blocks Tab

CIDR	RIR	In use	Status	Mask	Minimum value	Maximum value	Aggregatable
5.104.168.0/23	RIPE	Unknown	Virtual	23	\$21,196.80	\$25,907.20	no
78.142.4.0/23	RIPE	Unknown	Virtual	23	\$21,196.80	\$25,907.20	no
82.118.246.0/23	RIPE	Unknown	Virtual	23	\$21,196.80	\$25,907.20	no
178.132.84.0/23	RIPE	Unknown	Virtual	23	\$21,196.80	\$25,907.20	no
46.253.134.0/24	RIPE	Unknown	Virtual	24	\$10,828.80	\$13,235.20	no
78.128.92.0/24	RIPE	Unknown	Virtual	24	\$10,828.80	\$13,235.20	no
78.128.94.0/24	RIPE	Unknown	Virtual	24	\$10,828.80	\$13,235.20	no
78.142.1.0/24	RIPE	Unknown	Virtual	24	\$10,828.80	\$13,235.20	no
78.142.17.0/24	RIPE	Unknown	Virtual	24	\$10,828.80	\$13,235.20	no

The Virtual tab displays blocks that are not directly created or in use, but are inherited subnets under the netblocks discovered by scans. These blocks have an estimated total value based on the full netblock mask being free. Virtual blocks which have real children are not sellable.

Virtual Blocks: Example

In this example, we use a /17 at the top of the block tree, split down to eight /20s, with one /20 split down into two /24s, and another into two /26s on the other side of the tree.

In this diagram, the "real" created netblocks are displayed in black - these are the netblocks that would be displayed in the Analyze tab - Blocks list. These blocks may or may not be sellable, depending on use status and whether IPs exist under them.

The lighter grey blocks - the /19s and remaining /20s - are virtual blocks. They have not been created as "real" blocks, but can be inferred based on the ownership of the parent /18s and tree structure.

Virtual Blocks vs Real Blocks example diagram

Virtual Blocks and Sellable Status

In our standard Blocks list tab, if our example /20 with the /24 from it contains 50 IPs, none of the real netblocks are considered sellable - the /20 is not a leaf and the /24 (although it is a leaf) has IPs in it. This would result in a \$0 value estimation for the known existing blocks - which is not accurate when considering the entire tree structure. The /20 has many other netblocks under it which are not created or in use, and thus are free to be sold. These "not created" netblocks are displayed under the Virtual tab in ReView.

Virtual netblocks which have real children are not sellable, but those that are fully free without real children may be sellable. These show in the Virtual Blocks tab with an estimated value based on the full mask value being free.

Under our example parent block CIDR 50.100.16.0/20, the parent masks (/21, /22, /23) of our /24s - 50.100.17.0/24 and 50.100.26.0/24 - are not sellable, due to the /24s being real children. The same would apply to the parent blocks between our 50.100.80.0/20 and /26s on the other side of the tree. The remaining virtual blocks without real child blocks, however, would be sellable in this example.

Working with the Analyze Tab

Before You Begin

The Analyze tab interprets the netblock information gained from the Discovery and Inventory tabs and then combines that data with current available pricing estimations to provide an as-is valuation of free blocks.

Here are some steps that should be completed to ensure the Analyze tab has the best possible data available to determine pricing.

1. Ensure that Discovery steps are complete - double check that sources, devices, ping scans, etc have been comprehensively added to discovery and cover the desired extent of your network.
2. Go through the To-Do List tab and verify listed blocks have been scanned or ignored as needed.
3. Confirm blocks under the Inventory tab have the correct use status flags (in-use, free, unknown, ignored) assigned, and that any non-discoverable netblocks under consideration have been manually added to the Inventory List.

Once the data has been confirmed, you're ready to work under the Analyze tab!

Step 1: Review Netblock Status

The Analyze list is populated with netblocks which have been marked as unused or unknown, and are sellable or potentially sellable blocks.

Sellable blocks: Blocks are considered "sellable" if they meet one of these conditions

- are marked as "Free"
- are leaf only netblocks with "Unknown" status, and no IPs in them

In this tab, it is best to review netblock status (in-use, free, unknown, ignored) to confirm the correct status was assigned under the Inventory list.

Update Netblock Use

To make changes to the use status of a block, right click anywhere on a row to open the Action Menu and select to mark netblock use as unknown, in use, free, or ignored.

CIDR	RIR	In use	Status	Mask	Minimum value	Maximum value	Aggregatable	Options
185.148.160.0/24	RIPE	Unknown	Unknown	24	\$0.00	\$0.00	no	⚙️
185.148.160.0/25	RIPE	Unknown	Unknown	25	\$0.00	\$0.00	no	⚙️
185.148.160.64/28	RIPE	Unknown	Sellable	28	\$604.80	\$739.20	no	⚙️
185.148.160.128/25	RIPE	Unknown	Sellable	25	\$5,184.00	\$6,336.00	no	⚙️
185.148.161.0/25	RIPE	Unknown	Sellable	25	\$5,184.00	\$6,336.00	no	⚙️
185.148.161.128/25	RIPE	Unknown	Unknown	25	\$	Unknown	no	⚙️
185.148.161.128/26	RIPE	Unknown	Sellable	26	\$	In Use	no	⚙️
185.148.161.192/26	RIPE	Unknown	Sellable	26	\$	Free	no	⚙️
178.132.84.0/23	RIPE	Unknown	Sellable	23	\$	Ignored	no	⚙️

To make changes to the use status of a block, right click anywhere on a row to open the Action Menu and select to mark netblock use as unknown, in use, free, or ignored. The marked use will be considered when determining sellable status, valuation estimates, and optimization suggestions.

Step 2: Get Suggestions

Get Suggested Plan

after execution):

M: **\$29,060,774.40**

PI

Once netblock use status has been reviewed for accuracy, click "Get Suggestions" to see optimization strategies (Note: Depending on the size of netblock inventory, the suggested strategy may take a minute to load).

Get Suggestions displays three panels and their associated values:

- [Network structure before plan](#) - This shows the network structure as currently discovered, with pricing estimates based on keeping sellable blocks as-is at their current hierarchy location and size.
- [Results \(after execution\)](#) - This shows the network structure optimized to locate as many sellable blocks as possible contiguously, within the current structure strategy. This consolidates as many sellable blocks as possible, without otherwise making changes to the network structure.
 - The Optimization algorithm takes the following steps, generally:
 - Remove empty leaves
 - Shrink netblocks
 - Renumber netblocks, while preserving the number of levels as originally structured
 - If the structure - after removing empty leaves- was 4 levels, after optimization it will have 4 levels as well, with each parent containing exactly the same number of children.
 - This plan should be applicable to the existing network of the customer as we preserve parent-child relations.
- [Minimal Structure](#) - Minimal structure proposes the greatest possible consolidation of sellable blocks, including minimizing the existing network hierarchy and reallocating assignments to only use the fewest blocks needed. This allows for far greater availability of contiguous sellable blocks, larger masks, and higher profit potential, but may not be realistically applicable to some needs.
 - The Minimal Structure algorithm takes the following steps:
 - Get only the leaves with IPs in them
 - Remove all intermediary netblocks
 - Consolidate to a single parent

After getting the suggested plan, you may opt to review the Config Dif or the list of free netblocks.

Config Dif

Click the "Config Dif" tab under Get Suggestions to review a detailed list of configuration differences between the current state and suggested plan. This will assist in implementing the suggested plan.

The screenshot shows a web interface titled "Suggested plan" with two tabs: "Plan" and "Configs Diff". The "Configs Diff" tab is active, displaying a comparison between "Old Config" and "New Config".

At the bottom of the interface, there is a "Free Netblocks" button, a "Plan Name" field with a "Type plan name..." placeholder, and "Copy to clipboard", "Save plan", and "Cancel" buttons.

You may save the plan, copy it to clipboard, and view free netblocks.

Free Netblocks

Click on "Free Netblocks" and select a plan strategy to view a list of free netblocks under the plan.

The screenshot shows the 'Suggested plan' interface with three columns of data:

- Network structure before plan:** INITIAL SUM: \$23,922,342.40. Lists CIDR blocks from 8.0.0.0/12 down to 8.1.0.0/18.
- Results (after execution):** FINAL SUM: \$29,060,774.40. Lists CIDR blocks from 8.0.0.0/12 down to 8.0.11.0/2.
- Minimal structure:** MINIMAL SUM: \$29,455,032.20. Lists CIDR blocks from 8.0.0.0/12 down to 8.0.43.0/24.

At the bottom, there is a 'Free Netblocks' button circled in red, a 'Plan Name' input field with 'Type plan name...' placeholder, and 'Save plan' and 'Cancel' buttons.

The Free Netblocks list will display with a list of CIDRS, and the estimated min/max values associated with them.

Free Netblocks		
Results 602		
Netblock	Min value	Max value
50.100.0.0/16	\$3,299,737.60	\$3,647,078.40

8.5.96.0/19	\$357,990.40	\$395,673.60

Save Suggested Plan(s)

Save the suggested plan by entering a plan name and clicking "Save Plan". Saved plans are available for review and comparison under the "Planning" Tab.

The screenshot shows the 'Suggested plan' interface with updated values:

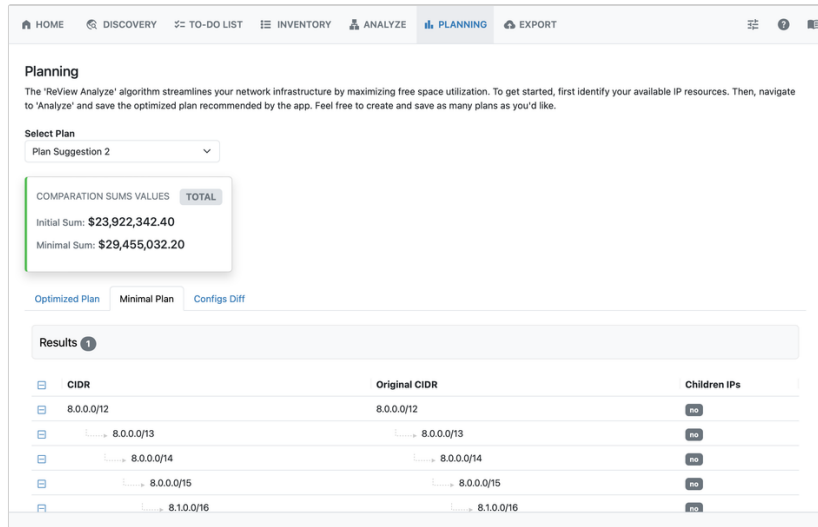

- Network structure before plan:** INITIAL SUM: \$4,653,465.60. Lists CIDR blocks from 8.0.0.0/12 down to 8.1.0.0/19.
- Results (after execution):** FINAL SUM: \$32,872,960.00. Lists CIDR blocks from 8.0.0.0/12 down to 8.2.11.0/2.
- Minimal structure:** MINIMAL SUM: \$37,855,641.60. Lists CIDR blocks from 8.0.0.0/13 down to 8.2.168.0/24.

At the bottom, there is a 'Free Netblocks' button, a 'Plan Name' input field with 'Plan Suggestion 1' placeholder, and 'Save plan' and 'Cancel' buttons. The 'Save plan' button is circled in red.

Next Steps

Next, proceed to the [Planning](#) tab to review and compare saved plans.

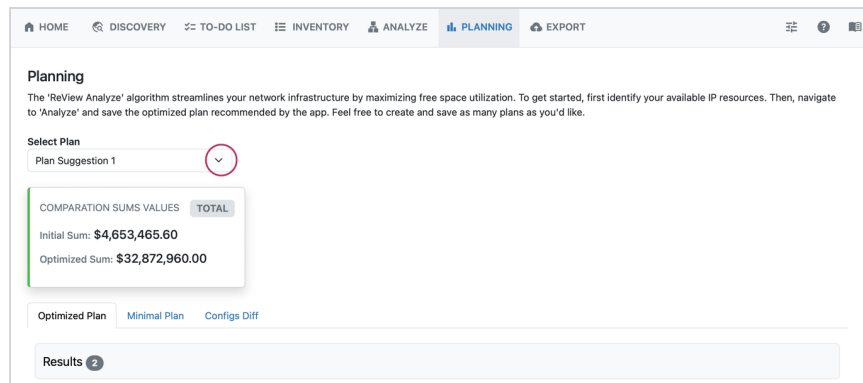

Planning

The Planning tab shows the potential value for plans saved under the Analyze tab. Here, you may view the Optimized Plan, Minimal Plan, and Configs Diff for each plan saved from the Analyze Tab - Get Suggestions step.

Select Plan

At the top of the page, click on "Select plan" to open the list of saved plans.

Then, select which saved plan to view.

Planning

The 'ReView Analyze' algorithm streamlines your network infrastructure by maximizing free space utilization. To get started, first identify your available IP resources. Then, navigate to 'Analyze' and save the optimized plan recommended by the app. Feel free to create and save as many plans as you'd like.

8.0.0.0/12	8.0.0.0/12	no
8.0.0.0/13	8.0.0.0/13	no
8.0.0.0/14	8.0.0.0/14	no
8.0.0.0/15	8.0.0.0/15	Show (18149)
8.1.0.0/16	8.1.0.0/16	no

The plan will load organized into three subtabs: Optimized Plan, Minimal Plan, and Config Diff.

For each plan, the plan CIDR, original CIDR, and child IP status is displayed.

The **Optimized Plan** shows the optimal consolidation plan, keeping the current network structure and number of levels intact:

Planning

The 'ReView Analyze' algorithm streamlines your network infrastructure by maximizing free space utilization. To get started, first identify your available IP resources. Then, navigate to 'Analyze' and save the optimized plan recommended by the app. Feel free to create and save as many plans as you'd like.

Select Plan
 Plan Suggestion 1

COMPARISON SUMS VALUES TOTAL
 Initial Sum: \$4,653,465.60
 Optimized Sum: \$32,872,960.00

Optimized Plan Minimal Plan Configs Diff

Results 2

CIDR	Original CIDR	Children IPs
67.221.240.0/20	67.221.240.0/20	Show (464)
8.0.0.0/12	8.0.0.0/12	no
8.0.0.0/13	8.0.0.0/13	no
8.0.0.0/14	8.0.0.0/14	Show (30664)
8.2.0.0/15	8.2.0.0/15	no

The **Minimal Plan** displays the highest value strategy to give the most free space, consolidating the structure into the fewest possible netblocks:

Planning

The 'ReView Analyze' algorithm streamlines your network infrastructure by maximizing free space utilization. To get started, first identify your available IP resources. Then, navigate to 'Analyze' and save the optimized plan recommended by the app. Feel free to create and save as many plans as you'd like.

At this point, you may wish to review and compare multiple strategies for different plans, and decide on which version you may wish to implement.

Next Steps

After reviewing plans from the Planning tab, you may optionally select to proceed to the [Export](#) tab to generate a network status report.

Export

HOME DISCOVERY TO-DO LIST INVENTORY ANALYZE PLANNING EXPORT

Upload Summary to IPv4.GLOBAL

This function will prepare a report on the state of your network and email it to both you and to IPv4.GLOBAL.

Upload Summary

The Export tab will prepare a report on the state of your network and email it to both you and to Ipv4.GLOBAL.

Enter an Organization Name and an email address and click "Upload" to send the report.

Generate PDF

You may download a PDF of the report by clicking "Download PDF".

The PDF format will be downloaded as a tabular montetization report, displaying CIDR, RIR, Use, Status, Min Sum, and Max Sum.

Basic Monetization Plan

CIDR	RIR	In Use	Status	Min Sum	Max Sum
8.3.184.0/24	ARIN	Unknown	Sellable	\$10,828.80	\$13,235.20
